Increased uncertainty drives the raters’ cut-offs further apart, implying even more lopsided splits in more opaque sectors (figure, bottom). The greater uncertainty in sector y implies a wider density around the mean, and hence, a flatter distribution. Heightened uncertainty in y implies greater risk of both underrating and overrating—that is what uncertainty means. The response of each rater to the uncertainty in y depends on the ratio Cu/Co for each rater. Risk analysis leads to decision analysis and making based on real and assumed calculated risks. Learn more in the Uncertainty, Risk. Petroleum industry, is amongst the high risks industry, from both surface and subsurface prospects. The objective of this course is to develop the expertise of the relevant engineers and practitioners in the oil and gas industry in the area of risk/uncertainty analyses and their relation to decision making process.
