Better health... Remember that you can ovulate and get pregnant during the month before your first menstrual period, as early as 3 weeks after childbirth. The average among women who breast-feed exclusively is 8 months.
Health Benefits. Best Types for Women. Getting Started. Safety and Side Effects. Such shifts occur because female bodies are extremely sensitive to calorie restriction. When calorie intake is low—such as from fasting for too long or too frequently—a small part of the brain called the hypothalamus is affected. This can disrupt the secretion of gonadotropin-releasing hormone (GnRH), a hormone that helps release two reproductive hormones: luteinizing hormone (LH) and follicle stimulating hormone (FSH) (7, 8).

There are also some stories online of women who report that their menstrual cycle stopped while following an intermittent fasting diet. If you have a medical condition, you should consult with your doctor before trying intermittent fasting.
