Darvill of the Cotswold-Severn Region: an assessment of certain architectural elements and their relation to ritual practice and Neolithic society.
Megalithic tombs have for long attracted the attention of archaeologists, but it is only since about the turn of the present century that systematic surveys and programs of excavation have been undertaken. One such survey, conducted on a co-operative basis between the Ordnance Survey of Ireland and my late colleague, Professor Ruaidhri de Valera of University College, Dublin, has been in existence for the past twenty years and is now in its final stages. It has been established that the megalithic tombs of Ireland number approximately 1,200 and that these fall into four distinct groups.

A chamber tomb is a tomb for burial used in many different cultures. In the case of individual burials, the chamber is thought to signify a higher status for the interree than a simple grave. Built from rock or sometimes wood, the chambers could also serve as places for storage of the dead from one family or social group and were often used over long periods for multiple burials. Chamber tombs are often distinguished by the layout of their chambers and entrances or the shape and material of the structure that covered them, either an earth barrow or stone cairn. A wide variety of local types has been identified, and some designs appear to have influenced others. Types and examples.
